

SoftwareUpdateServices

The `LDMGlobalEnabled` setting is read in the ObjC function:

```
+[SUUtility isLockdownModeEnabled]
```

Which is called via a `objc_msgSend` stub from the ObjC function:

```
+[SUUtility autoDownloadTimeInterval] {
    if ( [SUUtility isEqualToString:@"Internal"] ) && ![SUPreferences.sharedInstance
scanWeeklyInternally:v4] )
    {
        SULogInfo(@"[Auto scan] Apple Internal: Downloading every 2 hours");
        interval = 7200.0;
    }
    else
    {
        if ( [SUUtility isLockdownModeEnabled] )
            SULogInfo(@"[Auto scan]: Lockdown mode enabled: Downloading every 1 day");
        else
            SULogInfo(@"[Auto scan] Beta: Downloading every 1 day");
        interval = 86400.0;
    }
    return interval;
}
```

SoftwareUpdateServices

The `isLockdownModeEnabled` is also called from the following binaries in the Filesystem DMG:

- `/usr/libexec/mc_mobile_tunnel`
- `/System/Library/PrivateFrameworks/SoftwareUpdateServices.framework/Support/softwareupdateservicesd`
